What is a plug?

Plugs are grown from seed in trays filled with peat moss and soil. Because plugs are popped out of trays rather than dug up like "bare root" seedlings their root systems are almost completely undisturbed.

What are the advantages of a plug seedling over a bare root seedling?

Faster growth rates: Undisturbed roots mean faster root establishment resulting in faster top growth.

Higher survival rates: Plugs experience far less "transplant shock" than bare root seedlings resulting in better survival rates especially on sites with tough growing conditions.

Faster planting: Plugs are faster and easier to plant than bare root seedlings.
